

Activity: Employee Payroll System Using PHP and SQL

Objective

Create a simple web-based **Employee Payroll System** using **PHP** and **MySQL/SQL**. The system will accept employee information, calculate the payroll, and save the employee's payroll record in a database.

Part 1 – Create the Database

Open **phpMyAdmin** and create a database named:

employee_payroll

Create a table named:

payroll

with the following fields:

Field	Data Type	Description
id	INT	Primary Key, Auto Increment
employee_name	VARCHAR(100)	Employee Name
basic_salary	DECIMAL(10,2)	Basic Salary
hours_worked	INT	Number of Hours Worked
overtime_hours	INT	Overtime Hours
regular_pay	DECIMAL(10,2)	Regular Pay
overtime_pay	DECIMAL(10,2)	Overtime Pay
gross_salary	DECIMAL(10,2)	Gross Salary

Part 2 – Create the PHP Form

Create a file named:

index.php

Create a form that asks the user to enter:

Employee Name
Basic Salary
Hours Worked
Overtime Hours

Example:

EMPLOYEE PAYROLL SYSTEM

Employee Name:

[_____]

Basic Salary:

[_____]

Hours Worked:

[_____]

Overtime Hours:

[_____]

[COMPUTE PAYROLL]

Part 3 – Create the Payroll Computation

When the user submits the form, PHP should calculate the following.

1. Hourly Rate

Hourly Rate = Basic Salary ÷ 8

2. Regular Pay

Regular Pay = Hourly Rate × Hours Worked

3. Overtime Rate

Use 125% of the hourly rate:

Overtime Rate = Hourly Rate × 1.25

4. Overtime Pay

Overtime Pay = Overtime Rate × Overtime Hours

5. Gross Salary

Gross Salary = Regular Pay + Overtime Pay

Part 4 – Save the Data Using SQL

After calculating the payroll, use an SQL INSERT statement to save the information into the payroll table.

The data to be saved should include:

Employee Name
Basic Salary
Hours Worked
Overtime Hours
Regular Pay
Overtime Pay
Gross Salary

Part 5 – Display the Payroll Result

After submitting the form, display the result:

EMPLOYEE PAYROLL

Employee Name : Juan Dela Cruz
Basic Salary : ₱16,000.00
Hours Worked : 8
Overtime Hours: 2

Regular Pay : ₱16,000.00
Overtime Pay : ₱500.00
Gross Salary : ₱16,500.00

Part 6 – Display Saved Records

Create another PHP page named:

records.php

Use SQL SELECT to retrieve the saved payroll records.

Display them in an HTML table:

ID	Employee	Basic Salary	Hours	OT Hours	Regular Pay	OT Pay	Gross Salary
1	Juan Dela Cruz	16,000.00	8	2	16,000.00	500.00	16,500.00

Create a folder inside `htdocs`:

```
employee_payroll/  
├── index.php  
├── database.php  
├── save.php  
└── records.php
```

`index.php`

- Contains the payroll form
- Accepts employee information

`database.php`

- Contains the MySQL database connection

`save.php`

- Processes the form
- Calculates payroll
- Inserts the record into SQL

`records.php`

- Retrieves payroll records
 - Displays them in a table
-

Create a web-based Employee Payroll System using PHP and MySQL.

Your system must:

1. Create an `employee_payroll` database.
2. Create a `payroll` table using SQL.
3. Create an HTML/PHP form for employee information.
4. Accept the employee's name, basic salary, hours worked, and overtime hours.
5. Calculate the hourly rate.
6. Calculate regular pay.
7. Calculate overtime pay.
8. Calculate gross salary.
9. Save the payroll information into the MySQL database using PHP and SQL.
10. Display the computed payroll.
11. Create a separate page that displays all saved payroll records.
12. Format salary amounts to **two decimal places**.
